Highlights

- Light sharing lets trackers carry 2–3× more modules at a strict 90% yield floor.
- A neural controller adds 0.007 LER over a tuned window, null at equal retention.
- Mean-response designs leave 70% of pairs at the floor; an oracle reaches 87%.
- Conformal margins hold inside the ensemble; a learned design does worse.
- Even with the mean met, 24–31% of seasons miss the 90% yield floor.
