Highlights

- Light sharing allows 2–3× denser trackers at a 90% floor (proportional response).
- A learned shade response is no better than proportional loss for staple crops.
- A neural controller adds 0.007 LER over a tuned window (0.003 at equal retention).
- Design margins matter: 70% vs 85–87% of pairs at the floor (mean vs oracle).
- Plants beat agrivoltaics above 48 USD/MWh (64 at equal cost per watt).
